IMPACT OF HEART DISEASE
Cardiovascular, or heart, disease is a broad term for a range of diseases affecting the heart and blood vessels. Every three minutes, a person in the U.K. suffers a heart attack. Of the 175,000 heart attacks that are currently diagnosed each year in the UK, approximately 110,000 are among men and 65,000 are among women.

GOOD NEWS
A British Medical Journal study suggests that Abbott’s high sensitive troponin test* may help pick up twice as many women’s heart attacks as standard blood tests. Note: This test is not available in the U.S.

IMPORANCE to WOMEN
Abbott’s high sensitive troponin test* can measure very low levels of cardiac troponin. This is especially important for women, who often have lower levels of troponin than men. Note: This test is not available in the U.S.

WHAT IS TROPONIN?
Cardiac troponin is a protein that can indicate injury to the heart muscle. Troponin levels rise when heart cells are damaged. Doctors use blood tests to detect changes in these levels to help diagnose heart attacks.

HEART ATTACK SYMPTOMS
Chest pain is the most common symptom. Some symptoms are more likely to be experienced by women than men, including:
• Shortness of breath.
• Nausea/vomiting.
• Back or jaw pain.

WOMEN and HEART ATTACKS
Globally, twice as many women die from heart attacks and strokes than from all cancers combined. Women under 55 are at the highest risk of misdiagnosis of heart attacks.

KNOW THE SYMPTOMS, AND ACT FAST
Heart Attacks: How Women Can Beat the Odds
If you experience any symptoms of a heart attack, call emergency services immediately or seek medical attention. For more information about heart health, please visit www.abbott.com and www.worldheart.org.

*Abbott’s ARCHITECT STAT High Sensitive Troponin-I (hsTnI) test is commercially available outside of the United States. The test is in development and not commercially available in the United States.
